Larson T.G., Goodgal S.H.;

"Sequence and transcriptional regulation of com101A, a locus required for genetic transformation in Haemophilus influenzae.";

J. Bacteriol. 173:4683-4691(1991).

-: FUNCTION: Involved in transformation (competence for DNA uptake).

-: SUBCELLULAR LOCATION: Outer membrane (Probable).

-: SIMILARITY: BELONGS TO THE PULD/OUTD/EXED/XPSD FAMILY.

-!- FUNCTION: REQUIRED FOR SECRETION OF CHOLERA TOXIN THROUGH THE OUTER MEMBRANE.

-!- SUBCELLULAR AND SUBJECTION: Outer membrane (Potential).

-!- SIMILARITY: BELONGS TO THE EXED/OUTD/PULD/XPSD FAMILY.

-!- CAUTION: REF. 2 SEQUENCE DIFFERS FROM THAT SHOWN DUE TO A FRAMESHIFT (POSSIBLY NATURAL) IN POSITION 55.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                "DNA sequence of both chromosomes of the cholera pathogen Vibrio cholerae.",
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PROTEIN

"Association of the cytoplasmic membrane protein XpsN with the outer membrane protein XpsD in the type II protein secretion apparatus of Xanthomonas campestris pv. campestris.";

J. Bacteriol. 182:1549-1557(2000).

-I. FUNCTION: INVOLVED IN A GENERAL SECRETION PATHWAY (GSP) FOR THE EXPORT OF PROTEINS.

-I. SUBUNIT: Binds to XpsN.

-I. SUBCELLULAR LOCATION: Outer membrane (Probable).

-I. SUBCELLULAR LOCATION: Outer membrane (Probable).

"The complete hrp gene cluster of Pseudomonas syringae pv. syringae
for includes two blocks of genes required for harpinpss secretion that
are arranged colinearly with Yersinia ysc homologs.";

Mol. Plant Microbe Interact. 8:733-746(1995).

-: FUNCTION: INVOLUED IN THE SECRETION OF A PROTEINACEOUS ELICITOR OF
THE HYPERSUNITIVITY RESPONSE IN PLANTS.

-: SUBCELLULAR LOCATION: Outer membrane.

-: SIMILARITY: BELONGS TO THE PULD/OUTD/EXED/XPSD FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      630 EIPFTVTSIANGGSSTNTELKKAVLGLTVTP-NITPDG--QIIMTVKINKDSPAQCASGN

-i- FUNCTION: INVOLVED IN THE INVASION OF THE CELLS OF THE INTESTINAL EPITHELIUM. COULD BE NECESSARY FOR THE EXPORT OF INVASION RELATED DETERMINANTS.

-i- SUBCELLULAR LOCATION: Outer membrane (Potential).

-i- SIMILARITY: BELONGS TO THE PULD/OUTD/EXED/XPSD FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             R EMBL, X75302; CAA53049.1; -

"BfpB, an outer membrane lipoprotein required for the biogenesis of bundle-forming pill in enteropathogenic Escherichia coli.";
Dacteriol. 178:6555-653 (1996).
-: FUNCTION: Is absolutely required for pilus biogenesis, and for EPEC localized adherence and autoaggregation. Acts at a step in the BFP biogenic pathway after production and processing of the structural pilus subunit bfpA.
-: SUBCELLULAR LOCATION: Attached to the outer membrane by a lipid
                                                                                                                                                                    Bacteria; Froteobacteria; Gammaproteobacteria; Enterobacteriales;

X Stone K.D., Zhang H., Carlson L.K., Donnenberg M.S.;

X Cluster of fourteen genes from enteropathogenic Escherichia coli is wifficiant for biogenesis of a type IV pilus.";

XI M. Microbiol. 20:325-337(1996).

XI M. Microbiol. 20:325-337(1996).

C. I- FUNCTION: Is absolutely required for pilus biogenesis, and for EPEC localized adherence and autoaggregation. Acts at a step in the BFP biogenic pathway after production and processing of the structural pilus subunit bfpA (By similarity).

CC -: SUBCELLULAR LOCATION: Attached to the outer membrane by a lipid anchor (By similarity).
